Air pollution and Hedonic Prices Model

Emmanuelle Lavaine

December 16th, 2014

∃ ⊳

Dataset presentation Empirical methodology Empirical Results Conclusion

• The hedonic approach to evaluation (HPA) aims to estimate the economic value of a good using implicit price of the product attributes.

∃ >

Dataset presentation Empirical methodology Empirical Results Conclusion

- The hedonic approach to evaluation (HPA) aims to estimate the economic value of a good using implicit price of the product attributes.
- Hedonic model's appeal has always been the simple relationship between hedonic prices and consumer demand.

Dataset presentation Empirical methodology Empirical Results Conclusion

Ongoing debate

• Some economists are now using difference in difference and other quasi-experimental approach (Chay and Greenstone 2005, Currie et al. 2013)

< -□

∃ >

Dataset presentation Empirical methodology Empirical Results Conclusion

Ongoing debate

- Some economists are now using difference in difference and other quasi-experimental approach (Chay and Greenstone 2005, Currie et al. 2013)
- Others have questioned the welfare interpretation of the difference in differences hedonic pointing out it does not identify the MWTP usually associated with the first stage (Klaiber and Smith 2013; Kuminoff and Pope 2013)

Dataset presentation Empirical methodology Empirical Results Conclusion

Ongoing debate

- Some economists are now using difference in difference and other quasi-experimental approach (Chay and Greenstone 2005, Currie et al. 2013)
- Others have questioned the welfare interpretation of the difference in differences hedonic pointing out it does not identify the MWTP usually associated with the first stage (Klaiber and Smith 2013; Kuminoff and Pope 2013)
- Estimating the effect of a policy that influences the value of a parcel on that land's price may be different from estimating what an individual would be willing to pay to obtain the policy.

Dataset presentation Empirical methodology Empirical Results Conclusion

 Task is complicated by the problem of unobserved tastes and other demand shifters, which are systematically correlated with both level of public goods and marginal prices.

< 🗇 🕨

∃ ⊳

Dataset presentation Empirical methodology Empirical Results Conclusion

- Task is complicated by the problem of unobserved tastes and other demand shifters, which are systematically correlated with both level of public goods and marginal prices.
- Hedonic price function adjustment: shocks to the spatial distribution of public goods and changes in market fundamentals

Dataset presentation Empirical methodology Empirical Results Conclusion

• To what extent HPA captures people' WTP for perceived differences in environmental attributes when the hedonic price function may vary differently across market segments?

< -□

∃ ⊳

Dataset presentation Empirical methodology Empirical Results Conclusion

Motivation

- To what extent HPA captures people' WTP for perceived differences in environmental attributes when the hedonic price function may vary differently across market segments?
- Using a quasi experiment approach, with a pollution change, I show results may be different whether we consider different segments.

Dataset presentation Empirical methodology Empirical Results Conclusion

Motivation

- To what extent HPA captures people' WTP for perceived differences in environmental attributes when the hedonic price function may vary differently across market segments?
- Using a quasi experiment approach, with a pollution change, I show results may be different whether we consider different segments.
- Using France as an example, I show in a paper the difficulty to give welfare measures when hedonic equilibria may not be stable across segments after a shock.

Objective of the paper

• Looking at the causal relationship between a closure in the refining activity, local pollution levels for sulfur dioxide (SO2) and the property prices in the North of France, at a census tract level, for a panel data from 2008 to 2011.

Image: Second second

Objective of the paper

- Looking at the causal relationship between a closure in the refining activity, local pollution levels for sulfur dioxide (SO2) and the property prices in the North of France, at a census tract level, for a panel data from 2008 to 2011.
- Potential factors that affect both health outcomes and pollution

Objective of the paper

- Looking at the causal relationship between a closure in the refining activity, local pollution levels for sulfur dioxide (SO2) and the property prices in the North of France, at a census tract level, for a panel data from 2008 to 2011.
- Potential factors that affect both health outcomes and pollution⇒ We exploit exogenous variation in pollution due to an oil refinery closure in Dunkirk in France, in 2010.

Dataset presentation

• Detailed data on atmospheric pollution come from the information system of air quality measure of the French Environment and Energy Management Agency (ADEME): ambient air pollution concentrations in microgram per cubic meter $\mu g/m^3$

Dataset presentation

- Detailed data on atmospheric pollution come from the information system of air quality measure of the French Environment and Energy Management Agency (ADEME): ambient air pollution concentrations in microgram per cubic meter $\mu g/m^3$
- Weather data: average and maximum temperature in Celcius degree, the number of precipitation in millimeters, the maximum speed wind in meters per second, the prevailing wind direction in wind rose and the maximum and minimum relative humidity in percent.

Dataset presentation

 In a quasi experiment setting with fixed effects, this paper aims to analyze capitalization effects across segments, from a change in atmospheric pollution following the closure of a toxic site, on the prices of neighboring homes.

Conclusion

- In a quasi experiment setting with fixed effects, this paper aims to analyze capitalization effects across segments, from a change in atmospheric pollution following the closure of a toxic site, on the prices of neighboring homes.
- Positive effect of an improvement in air pollution on expensive properties prices.

- While buyers of expensive dwellings may have a relative stable hedonic equilibria to pollution, poorer home owners may suffer more of a relative income shock.
- Interpreting capitalization effects as welfare measures may not hold in every market segment.
