Research question

• Does financial development help mitigate CO_2 emissions? \rightarrow I assess the relationship between financial banking and market development and CO_2 intensities at country and industry level

Two mecanisms

1 Financial Development \rightarrow decreasing CO_2 intensity :

- Financial Development can facilitate the adoption of greener and less energy intensive technology.
- Financial development can establish strong corporate governance and the generation of both reputational and financial benefits, to initiate sustainable projects.

2 Financial Development \rightarrow increasing CO_2 intensity :

- Financial development promotes economic growth through risk diversification and technological advancement, which subsequently raises energy consumption.
- Financial development allows both households and firms to access affordable credit and funds, enabling the purchase of energy-intensive equipment by households and the expansion of business operations with energy-intensive equipment by firms.

Introduction Research Question Litterature Review & Contribution Stylized Fact Data & Empirical Strategy Results Conclusion	Litterature review Contribution
Litterature review (1)	

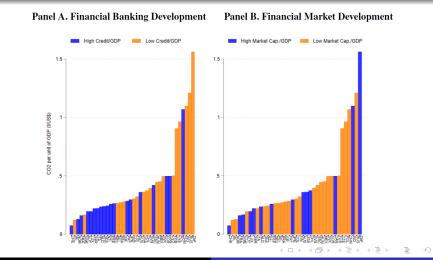

- Negative effect of financial development :
 - Tamazian et al. (2009) examine BRIC countries from 1992 to 2004.
 - Shahbaz et al. (2013, 2015, 2018) provide case study analysis of France, South Africa and Malaysia.
- Positive effect of financial development :
 - Shahbaz et al. (2015, 2016) provide case study analysis of India and Pakistan.
 - Acheampong (2019) examine 46 sub-Saharan Africa countries from 2000 to 2015.

- Not significant effect of financial development :
 - Abbasi and Riaz (2016) focus on Pakistan fom 1971–2011. They find no significant effect of financial development on CO_2 emissions per capita.
 - De Haas and Popov (2022) focus on 48 countries from 1990–2015. Financial development tends to have no impact on CO_2 emissions and Financial structure (market-oriented) reduce pollution.
- Non linear effect of financial development :
 - Kim et al. (2020) focus on 86 developing and advanced countries from 1989 to 2013. Financial development and CO_2 emissions are inverted U shaped and Financial structure and CO_2 emissions U shaped.

- First study to examine simultaneously the effect of financial banking (Credit/GDP) and market development (Market Cap./GDP) on CO₂ intensities
- Examine financial development effect at both the country and industry level
- First study to find that financial banking development is carbon mitigating and financial market development carbon increasing

Financial development and CO_2 emissions per unit of GDP (1995-2019)

A. Desroziers

Data Empirical Strategy

Data

Country dataset

- Unbalanced dataset covering 38 OECD and BRICS countries from 1995 to 2019
- The data contains information on CO_2 emissions per US\$ of GDP, CO_2 emissions per Capita, market capitalisation per GDP, domestic credit per GDP, market capitalisation per domestic credit, industry share per GDP, renewable energy consumption share to total energy, patent per capita, trade openness per GDP, FDI per GDP.

Industry dataset

- Unbalanced dataset covers 7 industries (WIOD) from 32 OECD and BRICS countries from 2000 to 2014
- The data contains information on CO_2 emissions per US\$ of industry value added

æ

Conclusion

- Asymmetric effect of financial development on pollution at the country level
 - Financial banking development reduce CO_2 intensity
 - Financial market development increase CO_2 intensity
- Industry level results suggests
 - Financial banking is carbon mitigating in construction, mining, service, and transport industries and carbon intensive in manufacturing industry
 - Financial market development exhibit no significant effect

 \rightarrow Future environmental policy should reconsider the substantial greening impact of banks and reassess the role of financial markets
