HOW TO THINK “GREEN” DURING ECONOMIC CRISIS?

THE BIG INTERVIEW
GERARD MESTRALLET

PARTNERSHIPS
FOCUS ON THE TOULOUSE NETWORK FOR INFORMATION TECHNOLOGY (TNIT)

Meet
NICOLAS TREICH...
Dear friends,

This summer, TSE enjoyed two major moments dedicated to discussions around economics. First of all there was the 1st edition of the TIGER Forum in June, attended by some of the great names in our discipline, such as Eric Maskin, Olivier Blanchard and Jean-Claude Trichet. The overwhelming response for the very first edition of this event encourages us to continue and further enhance this experience. On page 10, we start to lift the veil on the 2014 edition and its prestigious guests and events… In August, we hosted the EAERE Congress: 700 environmental and natural resource economists debated the challenges facing us and the event confirmed the unique role played by TSE in this specialised field.

Two partners of TSE have been kind enough to contribute to this 4th issue of TSE Mag: the CNRS (French National Centre for Scientific Research), through the voice of Patrice Bourdelais, Director of its Social Sciences Department, and GDF-SUEZ, via its CEO Gérard Mestrallet and its Director of Strategy, Edouard Saugère. These interviews illustrate the dual approach that has created the reputation of TSE as a close partner of both science and industry. This edition, just like the previous editions of TSE Mag, will also offer you a look at the diversity and excellence of the researchers at TSE: whether they are working on technology, purchasing behaviour, market liquidity, sustainable development or digital networks, they demonstrate the rich diversity of the TSE community and their ability to work in fields where you might not expect to find them, but where their work helps to light the way for public and private decision makers alike.

Finally, you will discover the two latest grants given by the European Research Council (ERC) to Patrick Rey and Thomas Chaney, bringing the total number to 11. TSE thus confirms its position as the first French institution in terms of ERC grants in economics by far, with 58% of the total French grants.

Jean Tirole
Christian Gollier
Two hundred years ago, cross-country differences in income were relatively small. European countries and Western offshoots were on average 90% richer than the rest1. By year 2000, this gap had grown to 750%. Most economic studies of long-run development have tried to relate current income differences to predetermined factors, such as genetic endowments, cultural differences, climate and institutions. Typically, these explorations regress current income per capita on pre-determined drivers, finding high correlations. These exercises, however, are not very informative about the mechanisms by which the dramatic differences in income have emerged across countries or about the timing of the divergence.

In a recent paper titled “If technology has arrived everywhere, why has income diverged?” Diego Mestieri and Marti studied whether the cross-country evolution of direct measures of technology can influence the allocation of resources and bring about international differences in income. To address this question, they first identify the two adoption margins of technology: the extensive margin and the intensive margin.

**EVOLUTION OF ADOPTION MARGINS**

In this article, the researchers analyze how technology diffusion accounts for most of the widening in the income gap between rich and developing countries since the Industrial Revolution.

They identify the extensive and intensive adoption margins for 25 significant technologies invented over the last 200 years in an (unbalanced) sample that covers 132 countries. Then, they use the estimates to study the cross-country evolution of these two adoption margins. They uncover two new empirical regularities. First, cross-country differences in adoption lags have narrowed over the last 200 years. That is, adoption lags have declined more in poor/low adopter countries than in rich/fast adopter countries. Second, the gap in penetration rates between rich and poor countries has widened over the last 200 years, inducing a divergence in the intensive margin of technology adoption.

**INCOME DYNAMICS**

They next explore how technology dynamics affect the evolution of income by stimulating the dynamics of demand for technology can have implications for economic growth.

In contrast, when they simulated the average US household, they found that US households have healthier purchasing patterns than US households despite the prices and product offering they face, not because of them.

In their study, they explore how differences in food purchases and nutritional outcomes across these three countries. For example, US households purchase more calories per person. A greater percentage of those calories come in the form of carbohydrates, and a lower share in the form of proteins. A higher share of expenditure is on drinks and prepared foods, and a lower share is on fruits and vegetables. They also document substantial differences in prices and nutritional characteristics like carbohydrates, proteins and fats composition of foods across the three countries. Their main contribution is to develop a model of demand for food products and nutrients allowing to answer whether prices and nutritional characteristics can explain the observed differences in food purchases. This is done using large household-level (home scanner) data from France, UK and US that include detailed food purchases for an extended period. They find that, if faced with French prices and product attributes (such as macro nutrients), the average US household would purchase substantially fewer calories: a similar level to the average French household when faced with the same environment. However, the composition of these calories would differ. If only the nutrient characteristics were changed, this has little impact on the amount of calories the average US household obtains, though it does affect the form of those calories, shifting them away from carbohydrates and towards proteins and fats.

In contrast, when they simulated the average US household’s food basket with UK product attributes this has a substantial impact on reducing calories, whereas changing relative prices in fact increases calories.

Sophie Moinas

Liquidity supply across multiple trading venues

What are the motivations for this research project?
Sophie Moinas. In the last decade, the financial industry has drastically changed. Innovations and changes in regulation (such as the RegNMS* in the U.S. or the MiFID** in Europe) have fragmented the markets and given rise to a proliferation of trading venues. A reaction of the Buy Side (that is, investors, asset managers, hedge funds) has been to develop search engines like Smart Order Routing Systems, and execution algorithms to split their orders to buy or sell securities across trading platforms. A reaction of the Sell Side (that is, investment banks) has been to engage into «multi-venue market making», or, as Getco for instance uses to call itself, to engage into «multi-venue market making», across trading platforms. A reaction of the Buy Side (that is, investors, asset managers, hedge funds) has been to develop search engines like Smart Order Routing Systems, and execution algorithms to split their orders to buy or sell securities across trading platforms. A reaction of the Sell Side (that is, investment banks) has been to engage into «multi-venue market making», or, as Getco for instance uses to call itself, to engage into «multi-venue market making», across trading platforms.

What is your approach?
SM. The paper first looks at the impact of fragmentation with the help of an innovative model that analyses the behaviour of global dealers in a fragmented market. The primary objective of this theoretical analysis is to understand the economic forces that are at stake in global market making. How does fragmentation impact risk? Intra-market competition? Inter-market competition? The analysis shows that transaction costs, as measured by market bid-ask spreads, are significantly impacted by the divergence of dealers’ global inventories, and are related to the size and the direction of order flows routed to the other venue. As a second step, we use a proprietary dataset on cross-listed stocks to empirically analyze the order submission strategies of a subset of members that we identify as global dealers. We show that these members actively manage their inventory, and that conditional on execution, they adjust their quotes in the alternative platform. As predicted by our model, we also find that quotes’ aggressiveness depends on the dispersion in dealers’ inventory positions.

What are the implications for public policy?
SM. Market fragmentation is usually seen as increasing inter-market competition (e.g. decreasing the direct transaction costs like the fees charged by the platforms), but at the expense of indirect transaction costs (e.g. decreasing market liquidity). We find that, when liquidity suppliers are active in different venues, which is the case now, they actually consolidate the markets and therefore mitigate the negative effect of competition, while increasing not only inter-market competition on fees, but also intra-market competition between dealers.

Sophie Moinas tells us more about “Liquidity Supply across Multiple Trading Venues”, a recent paper co-authored with Laurence Lescourret (ESSEC) for which she received the Joseph de la Vega Prize for an outstanding research paper related to the securities markets in Europe from the Federation of European Securities Exchanges (FESE).

LEARN MORE...

*RegNMS National Market System (NMS) is a set of rules passed by the Securities and Exchange Commission (SEC), which looks to improve the U.S. exchange through improved fairness in price execution as well as improve the display of quotes and amount and access to market data.

**MiFID Markets in Financial Instruments Directive is legislation for the regulation of investment services within the European Economic Area.

About our researchers

Pierre Dubois
Pierre Dubois is Professor of Economics at the Toulouse School of Economics of the Toulouse 1 Capitole University, a senior research fellow of the Institute of Industrial Economics (IDEI) and a Junior Member of Institut Universitaire de France. He obtained a Ph.D. from EHESS, Paris, in 1999. He is also a research fellow of CEPR and ELOON, a member of the scientific council of the University of Toulouse, an academic panelist of the UK competition commission. Pierre Dubois is also Managing Editor of International Journal of Industrial Organization, Associate Editor of Annals of Economics and Statistics and of European Economic Review. His research is broadly in empirical microeconomics, focusing on several areas of development economics and more recently in empirical IO, food demand, health and pharmaceutical.

Martí Mestieri
Martí Mestieri holds a Junior Chair position at TSE and is a member of IAST. Prior to joining TSE, he obtained a Ph.D. in economics at MIT. He is particularly interested in human capital acquisition and technology adoption. His research topics include the study of the interplay between technology diffusion and economic development, the effects of the IT revolution on wage inequality and the pattern of specialization, and the design of educational systems in the presence of private information and borrowing constraints.

Sophie Moinas
Sophie Moinas is Professor of Finance at INSE Toulouse (University of Toulouse), researcher at the CRM and member of Toulouse School of Economics and IDEI. She received her doctorate from HEC in 2005. For her research, Sophie Moinas received the PhD Thesis Award from the French Finance Association and Euronext in 2006, research grants from from Europlace Institute of Finance in 2009 and 2010, and from the French National Research Agency in 2009 for a project on "Algorithmic Trading". Her recent work focuses on market fragmentation.
Nicolas Treich is research director at INRA, at Toulouse School of Economics. He was this year the scientific director of the European Association of Environmental and Resource Economists (EAERE) conference, and is a member of the chair “Finance Durable et Investissement Responsable” (FDIR). In this interview, he expresses his views over the current environment and economic growth link with a special focus on the stake of the French Government on this matter.

How evident is it to link environment with the economic growth?

Nicolas Treich. The link between environment and economic growth (or crisis) has been extensively studied. One line of research concerns the so-called “environmental Kuznets curve”, which identified an inverted U-shape relation between pollution and per capita income. That is, environmental quality tends to deteriorate at early stages of development, but then improves at later stages. A key ingredient to explain this relationship is that environment seems to be a normal good, namely people with higher income demand more environment quality. With that respect, the current crisis may be bad news for the environment, since people have less income on average.

What is the stake of the politicians on this matter?

NT. Politicians often suggest that the efforts to protect the environment also offer an opportunity for economic development, and in particular for employment. For instance, members of the current government stated this summer that the ecological transition should create 1 million jobs by 2025. Unfortunately, I have not seen a sound economic analysis that can back up such political statement. My belief is instead that this ecological transition likely will not create many jobs in “net”, meaning that it may indeed create “green jobs” but it may also destroy “brown jobs”, and the net figure might well be negative overall. The previous government made a similar claim in 2007 that the Grenelle de l’environnement will create more than 500,000 jobs by 2020. Given the global trend of (un-)employment in 2007, it is indeed difficult to “afford” the cost of new efficient policies. To me, the key issue then is to compare this cost to the benefit generated by environmental policies. That is, firms make voluntarily efforts to reduce pollution, and in doing so they please some citizens and consumers, that purchase their products and prevent from boycotting the firm for instance. This new approach shows promise, as indicated by some research developed at TSE under the chair Finance Durable et Investissement Responsable (FDIR). Nevertheless, and some of my colleagues like Stefan Ambec or Sebastien Pouget may disagree with me, I think the CSR is a frail concept. Indeed, it relies on the weak generosity of citizens, and on the ability to produce relevant and accessible information about the firms that truly make an effort in favor of the environment. So far, we have seen a lot of green-washing going on.

How can interdisciplinarity involvement help foster the policy controls and reach out to the society?

NT. The last topic about CSR illustrates the variety and the difficulty of the research on environmental issues. When one wants to think about the generosity of citizens, one naturally wants to rely on the research in psychology and sociology. Along similar lines, when one wants to better understand environmental lobbying, it may be useful to interact with political scientists. As an illustration of the interdisciplinary nature of these issues, the environmental economics department at TSE has developed in the last couple of years a common research effort with the interdisciplinary Institute of Advanced Study in Toulouse (IAST). We have organized conferences like on “behavioral environmental economics” in 2012, on “biology and economics” or the EAERE this year) where interdisciplinary research on environmental issues was well represented.

Interview with Nicolas Treich
TIGER Forum 2014

Global structures in expanding economies

Save the date: 2-6 June 2014

After the successful launch of TIGER Forum in 2013, TSE announces the second edition. TIGER Forum 2014 will offer 6 academic conferences, as well as high-level policy roundtables, so as to attract the attention of academics, decision-makers and the media.

Programme overview:
The TIGER Forum 2014, besides enhanced policy events, will include scientific conferences in the following fields:
- Energy Industry at a crossroad: preparing the low carbon future
- Kuhmo Nectar annual conference of the International Transportation Economics Association (ITEA)
- Workshop on the military in politics in the 21st century
- Workshop on health economics
- Workshop on development economics
- Workshop on economics & religion

Follow the progress and stay informed:

The energy transition is at the centre of public debate: what are GDF-SUEZ’s responses to the challenge of reducing greenhouse gas emissions?

Gérard Mestrallet (GM). As a global energy company, GDF SUEZ is convinced of the need to engage in this transformation and actively seeks to contribute to the national debate on the issue. We support the idea of a two-pronged approach to the energy transition:
- Speeding up energy efficiency policies, focusing in particular on thermal renovation of the homes which consume the most energy. Residential and office buildings account for more than 40% of the country’s energy consumption, so we have proposed a renovation passport scheme which will be applied to all new houses at every step of the refurbishment work they undertake.
- Developing a balanced energy mix – the debate in France all too often focuses on electricity alone. Energy is used for a wide range of purposes – heating, transport, industrial use, etc. We need to find the right form of energy for each need. Renewable gas, i.e. biogas from waste fermentation, is a very relevant form of energy for heating or for powering vehicles. It’s an environmentally and financially promising renewable energy source which is often overlooked.

This two-pronged approach focusing on energy efficiency and diversified production lies at the heart of our strategy: we promote GDF SUEZ as a partner of the Toulouse School of Economics (1990s at IDEI (Institut d’Économie Industrielle) in Toulouse convinced GDF Suez of the necessity of supporting this project.

Aside the satisfaction of having contributed to the emergence of a spearhead in research economic, GDF SUEZ was involved in the creation of the TSE Foundation and what are the consequences of this partnership for GDF-SUEZ?

Edouard Sauvage (ES). Jean-Qaques Laffont was a great contributor to the renewal of economics through his writings on the role of information in analyses of relationships between economic players. His personal aura and the talent he brought together in the 70’s at IDEI (Institut d’Économie Industrielle) in Toulouse convinced GDF Suez of the necessity of supporting this project.

What do you think of the current debates on ethics and conflicts of interest among economists? How can economists’ freedom of research be guaranteed where there are close ties with businesses?

ES: The current debates you refer to were sparked in the United States where economists’ close ties with powerful financial institutions were vehemently criticized in the wake of the financial crisis. They spread to Europe focusing on a economists with high government visibility effort, avoiding national initiatives which, due to lack of coordination, risk under-optimisation cross-border exchanges and pushing up the cost of a secure supply.
- Promote renewable energies in a more sustainable manner: the support mechanisms in place to promote renewables have always been disorganised and disconnected from actual demand in the consumer countries, which has had a damaging effect on the price paid by consumers and the competitiveness of European companies. It is essential that renewables subsidies be geared towards profitability and the market.
- Continue to invest in promising technologies like energy storage, carbon storage and sequestration, meters and intelligent networks, shale gas and renewable energies.
- EU political leaders must actively try to lay down new guidelines for European energy policy. I would like to emphasise that investments in the energy sector contribute not only to the supply of a safe and effective product, but also to job creation and economic revitalisation.
Focus on the **Toulouse Network for Information Technology (TNIT)**

The Toulouse Network for Information Technology is funded by Microsoft & managed by Jacques Crémer, TSE Scientific Director, and Yassine Lefouili, TSE Researcher.

**Why was this network created?**

Yassine Lefouili: The TNIT was created in 2005 to stimulate high-quality economic research on the software industry, the role and impact of the Internet, and intellectual property. The aim of the network is to encourage some of the best academic economists in the world to engage on the issues generated by the fast development of information technology. We have members from MIT, Stanford, Harvard, Chicago…

To meet TNIT’s expectation of world-class research, the members enjoy complete academic independence in their work.

**How often do the members come together?**

YL: Almost 70 academic papers have been produced since 2005 by the TNIT members as part of their involvement in the network. Many of these papers have been published in top economics journals such as the American Economic Review, Econometrica, the Journal of Political Economy and the Quarterly Journal of Economics. Here are two examples of very recent work by members of the network.

In "Sales Mechanisms in Online Markets: What Happened to Internet Auctions", a paper that was presented at the 2012 Annual Meeting, TNIT member Jonathan Levin and his co-authors explore the evolution of sales mechanisms in online markets. While consumers auctions were very popular in the early days of internet commerce, today online sellers mostly use posted prices. Using data from eBay, the authors argue that compositional shifts in the items being sold, or the sellers offering these items, cannot account for this evolution. They develop a model to distinguish between two hypotheses: a shift in buyer demand away from auctions, and general narrowing of seller margins that favors posted prices. They find that the former is more important. They also provide evidence on where auctions are still used, and on why some sellers may continue to use both auctions and posted prices.

In "The Nature and Incidence of Software Piracy: Evidence from Windows", a paper that will be presented at the 2013 Annual Meeting, TNIT member Susan Athey and Scott Stern use data from Microsoft Windows 7 to analyze software piracy by individual consumers; which they call "retail" piracy. They find that a large share of retail piracy occurs by using keys that are posted on Internet sites such as PirateBay, and that a small number of keys account for a large share of piracy. They then examine how piracy varies with the economic and institutional environment, showing that it responds to GDP and intellectual property protection. They also show that piracy responds to economic forces such as price and the time/bandwidth cost of downloading pirated versions.

**How can governments boost new high-potential ventures?**

September 2012 conference.

**Recent Event**

18-19 October 2013

TNIT annual meeting

Nine presentations of academics papers as well as three brainstorming sessions on the following topics: Big Data, Antitrust and Intellectual Property.

**In a Talk with Yassine Lefouili**

"Almost 70 academic papers have been produced since 2005 by the TNIT members as a part of their involvement in the network."
The need for multi and interdisciplinary research

The French National Centre for Scientific Research (CNRS) is a founding member of the Foundation Jean-Jacques Laffont - TSE. Patrice BOURDELAIS, Director of social sciences scientific department serves on the TSE Board of Directors. Historian and demographer, he has headed Humanities and Social Sciences at the CNRS since 2010. He is committed to European projects and has successively coordinated Erasmus Mundus Masters and Doctorate programmes on themes tied to his work on the "Dynamics of Health and Welfare."

> The CNRS and the fight to keep the HSS on the 2020 Framework Programme

Throughout the preparatory meetings on the FP8, the French Ministry for Research and the CNRS highlighted the importance of maintaining a dedicated HSS programme. Unfortunately, their efforts met with very limited success, and fundamental research in the HSS will receive very little funding, as if it failed to provide even an indirect response to the current economic crisis. The CNRS will, however, have to be involved in all the projects aimed at other issues. These programmes should thus strengthen multi- and interdisciplinary research. The collective failure of the HSS at the European level — because that is, in fact, what this represents — should encourage us to consider why these disciplines lack credibility for our politicians and leaders. We know that over the past few years, the situation has changed in the corporate world, where the HSS have proven that they can provide added value through relevant analyses and problem solving, but Brussels seems oblivious to the changes in research practices and the issues addressed. We are also responsible for changing a situation which has serious consequences for research in the HSS.

> The CNRS’ reverse brain drain policy

The CNRS has opened a number of permanent positions in different engineering fields, biology and physics, which made it possible to recruit young French postdocs who had spent time abroad in addition to foreign researchers. In recent years, one-third of all CNRS recruitments, including in the HSS, have been foreign researchers, proof that our laboratories remain attractive, even for researchers from the rest of Europe. Funded chairs offer excellent working conditions, as did the opportunity to offer permanent contracts in certain exceptional cases. The gap between researchers’ and professors’ salaries in France and abroad is a particularly pressing issue in economics. The RTRA and the foundations created five years ago form a framework which has made it possible to develop viable solutions. As part of its new site-based policy, the CNRS can also work with local partners to support new staff arriving in France by forming a team of IT and BIATTS (library, engineering, administrative, technical, social and healthcare) staff. I'd also like to note that in addition to looking at net salaries, our staff also looks at healthcare costs and quality and the availability of free education from preschool through secondary school, which mean that fortunately for us, depending on where they are in their lives and how many children they have, they may actually find it quite easy to move — or return — to France.

Interview with Patrice Bourdelais

The role of the CNRS in the development of the Humanities and Social Sciences

The CNRS contributes to the development of the Humanities and Social Sciences (HSS) through its annual financial support for research teams and the recruitment of researchers and IT experts. A recent review of the CNRS’ added value for HSS research clearly shows that the backgrounds of the researchers recruited made it possible to develop formal, quantitative and modelling-based approaches (e.g. in economics, linguistics and geography) and that the CNRS is currently investing far more than are universities in cultural fields and comparative studies, which are essential in today’s globalised world. At the INSFS, our priority is to bring an international dimension to all French HSS research. To that end, we have thirty units abroad which offer researchers the opportunity to live in close contact with their fields, we provide funding for medium-term (4-9 month) travel, and support major journals’ efforts to publish English editions online. Our second priority is supporting multi- and interdisciplinary research on topics where the HSS can go beyond a technical approach to provide a fresh perspective, and interdisciplinary research on topics where the HSS can go beyond a technical approach to provide a fresh perspective, including energy, sustainable development, augmented humanity and big data. Our third priority is promoting the development of the «Digital Humanities,» which are leading humanity and big data. Our third priority is promoting the development of the «Digital Humanities,» which are leading humanity and big data. Our third priority is promoting the development of the «Digital Humanities,» which are leading humanity and big data.
Companies: How to stay in contact with the school?

The school is putting in a lot of energy and is providing more means to develop relationships with companies that are essential to facilitate the training and integration of its students. We are convinced that these initiatives will not only have a positive impact but also a long lasting reputation amongst our partners. The reputation of the School continues to rise, both upstream and downstream. “Upstream of the School”: an increase in the number and level of university and “preparatory classes” students. “Downstream of the school”: more connections between the school and the business community. There are various channels through which the companies can stay in contact with the school: the ever growing Alumni network, the “Cercle du Bazacle” and the business talks, a recent initiative of the school to enable the students to interact with the professionals. The development of these connections proves to be beneficial to students, who in turn become the best ambassadors of the school in enterprises. Statistics show that a variety of sectors are represented in the student internships: industry (eg Airbus), services, banks, economic consulting firms, international institutions, regulators...

A new Business & International Relations Manager

In constant efforts to further improve the visibility of the school in the professional world, we have recruited a new Business & International Relations Manager - Lorna BRIOT.

Executive Education

The winners awarded during the EFMD’s Executive Development Conference in Stockholm, Sweden 9-11 October

EDF-TSE

Executive Education bags the prestigious EFMD “Excellence In Practice” award under the category Organization Development for their outstanding learning & development programme “Corporate Turnaround: Focusing, Aligning and Building for Success”.

Ph.D. at TSE

For the academic year 2013-2014, TSE Doctoral School enters its final phase of transition following the reform that was introduced two years ago. This new mode of progressive organization aims to provide a uniform curriculum to the students having chosen the “research” path within Toulouse School of Economics. Courses emphasize finding the right balance between diversification, getting a good general economics culture, and the specialization needed for effective research.

To know more about the program and the reform: http://www.ecole.tse-fr.eu/en/programs/doctoral-program

RECENT BUSINESS TALKS

3 October 2013

Benoît Coeuré, member of the Board of the European Central Bank on “New rules for monetary policy: is the central bank still a lender of last resort?”.

17 October 2013

Anne Perrot, partner at MAPP on “Competition Policy.”

22 October 2013

Arun Kumar Singh, Indian Ambassador to France on “Indian Economy and Business opportunities in India.”

NEWS FLASH

Joining us this academic year

They have come from Oxford, Princeton, Cambridge, Paris Dauphine, New York and elsewhere to further enrich the reputation of TSE & IAST.

New research grants

2 new ERC grants (duration 5 years)

Thomas Chaney
"FiNet : Firm Networks, Trade and Growth".

Patrick Rey
“Cooperation and competition in vertical relations: the business strategies and industry oversight of supply agreements and buying patterns”

3 new ANR grants (duration 3 years)

Martí Mestieri
"GRATE : Croissance, Adoption de Technologies et Commerce“ (ANR Jeunes Chercheurs).

Patrick Four & Franck Portier
“AMF Analyse des Multiplicateurs Fiscaux“ (ANR Programme Blanc).

Jean-Pierre Floreno
"PAREMA : Problèmes inverses et parcimonie pour la modélisation économétrique et applications“ (ANR Programme Blanc – multi-partenariat).

Prize and awards

Spaengler IQAM Prize

Augustin Landier and his co-authors J. Sauvagnat, D. Sraer, D. Thesmar have been selected by the Review of Finance as the winners of the Spaengler IQAM Prize at EFA 2013 for the best paper in the last year’s issues for “Bottom-Up Corporate Governance”.

Jean Tirole
is admitted as the Honorary Fellow of the Royal Society of Edinburgh. RSE announced this year 47 UK and International fellows elected following a rigorous examination of their achievements in their relevant fields. Honorary Fellows persons of truly exceptional distinction who have rendered outstanding service which is recognised by peer groups as original and inspirational and which demonstrates a sustained commitment. The maximum number of Honorary Fellows who may be elected in any one year by RSE is restricted to four.

Jean Tirole, receives two "Doctor Honoris causa" in May 2013:
> from the University
of Hitotsubashi (Tokyo), Susumu Yamauchi.
> from HEC Lausanne.

Scientific Council of TSE

New chairman

During its last meeting, Torsten Persson has been elected President of the Scientific Council of TSE. He succeeds to Richard Blundell and joins the Scientific Committee which has 16 members, now including four Nobel Laureates in Economics: Amartya Sen, Roger B.Myerson, Eric S.Maskin and Thomas J.Sargent who was awarded the Nobel Prize in 2011.

French Council of Economic Analysis (CAE)

Guillaume Plantin, Jean Tirole and David Thesmar (HEC) members of the French Council of Economic Analysis (CAE) have published a new public report on "Reforming French Bankruptcy Law".

New book

10 idées qui coulent la France
by AUGUSTIN LANDIER of TSE
coauthored with DAVID THESMAR of HEC

In this book the authors look at 10 specific economic fallacies which can be regrouped in three major families.

> Many government interventions and public subsidies are based on the belief that “reindustrialization” is the only way to avoid economic decline. They show that there is no reason to be afraid of the transition from an industry economy into a services economy, a transition that France has been going through.

> It is particularly toxic to assume that the incentives and informational frictions that make the functioning of private markets imperfect would suddenly cease to exist if decisions are taken by governmental agents: There is no such thing in reality as a benevolent planner. So naïve Colbertism leads to cronyism, arbitrary decisions, and a form of “subsidies capitalism” where a major determinant of a company’s success is its ability to attract public subsidies. This is not a particularly promising way out of our economic slowdown.

> Last, the authors are highly skeptical about the view that “World Governance” or “European Federalism” are realistic ways to get the French economy back on track: paradoxically politicians often invoke religious Europe or World Governance (e.g. the G20) as ways to put order in economic chaos; this is a very important dimension of their rhetoric and beliefs system. But at the same time refuse to take seriously the advice of supra-national bodies such as IMF, the European commission, which give precise recommendations about the type of structural reforms that France should undertake; and they often attack the policies of the ECB.

Yoram Bauman

Economics from the point of view of a stand-up economist

Yoram Bauman, Ph.D. in economics from University of Washington is the world’s 1st & only stand-up economist. Co-author of two volumes of the Cartoon Introduction to Economics, he has appeared in the TIME Magazine and Public Broadcasting Service (PBS). He has already shared the stage with Robin Williams & Paul Krugman to name a few & performs internationally on regular basis. TSE’ association with Yoram is directly linked to his friendship with Christophe Bontemps, engineer at the TSE-INRA lab, who has translated his book in French. TSE has had the privilege to host the Yoram Bauman show twice.

Christophe’s impression about Yoram and his book…

When Yoram told me “find an editor and translate it, that would be really cool, France is the home of comics,” I thought he was joking. I wouldn’t have thought seriously of translating an economic cartoon, but Yoram and the cartoonist Grady Klein were keen on doing a French version. Their enthusiasm proved convincing!

Above all, I really liked the original version and the incredible talent of Yoram in his shows. After signing with the editor (Eyrolles), I was daunted: translating is not easy, especially when it is a cartoon with at least one economic concept per page, jokes, onomatopoeia and pirates!

I finally met Yoram in London and it is around sashims and a glass of sake, that we really hit it off and considered a show at TSE. He is a remarkable person, an economist at 200%, engaged for the environment. It was great getting to know him.

Yoram Bauman…

My goal in life is to spread joy to the world through economics comedy; to reform economics education; & to implement carbon pricing. I had a good time at both TSE presentations. I remember reciting a sad but true joke about how climate change economists spend a lot of time flying around the world telling people that we need to spend less time flying around the world. The city of Toulouse is lovely, with a special thought to the local food! Coming from Seattle – the home to the Boeing manufacturing, there is a little bit competition there with Toulouse - home to Airbus!
